

5 Tips for Backing Up Your Data

An ounce of prevention is worth a pound of cure, so take a look at these top 5 tips for protecting your data:

1

Invest in Cloud Storage

The cloud has become one of the top ways businesses are keeping their data safe and accessible. There are many reputable cloud providers that can provide everything from hybrid cloud solutions to completely cloud-based infrastructures.

2

Encrypt Critical Data Files

If you have sensitive data, make sure to encrypt files before backing them up. An encryption service will code your data and create a password-protected file that can only be opened by authorized users. This will protect your information in case of a breach.

3

Set Up Automated Backups

Automated backups are a lifesaver, especially if servers are destroyed by a natural disaster or data gets stolen through ransomware. Set up automated backups that continually backup your files, providing copies are always updated and accessible.

4

Check Backups Regularly

Even automated backups need to be checked regularly to ensure they're working properly. This can be done manually by going through your backup files and checking to see that they're complete and error-free. But you can also automate this process with backup software that will automatically check your backups and let you know if there are any problems.

5

Work with a Data Backup Expert

If you want peace of mind, work with a data backup expert like Fusion Managed IT. We can help you set up a robust backup plan and make sure your data is always safe.

Keep these tips in mind to keep your data safe from hackers, natural disasters, and user error. With a little planning, you can rest easy knowing your information is always backed up and ready in case of emergency.
